

GUI, or Graphical User Interface, is a beginner-friendly navigation system for the computer that uses images and the mouse and keyboard to get around. The user can click and drag things around and open files intuitively. CLI, or Command Line Interface, can do all of the same things but utilizes a command console and written text to execute the same actions. It can be more efficient and can often do more things more easily than a GUI, but it requires knowledge of syntax and commands, making it less beginner-friendly.
